User Stories

Sprint 2 (expected to fit)

Story Owner: Grayson Lessard

Story 1: View valid commands (/help)
As a user, I want to be able to see a list of all the commands that the bot can run, when the /help command is used.

Acceptance Criteria

- Given I run /help using the bot, then a list of all commands and their syntax is returned to the chat.
- Given a new command is added to the bot, then it appears in /help without anyone rewriting the help text.
- Given I run /help, then the reply is only visible to me, so it does not fill the channel.

Tasks

- Create a new bot command with bot.py. (Grayson, 1 hour)
- Build the command list from the commands the bot has registered, so it stays up to date. (Grayson, 1.5 hours)
- Format each entry as the command name, its syntax, and a short description. (Grayson, 45 minutes
- Add a test that /help lists every registered command. (Grayson, 1 hour)

Risks

- The help text gets out of date if it is typed by hand and a command is added later.
- Several teammates edit bot.py at the same time, which can cause merge conflicts.
- Commands are added to the bot in other stories (such as /remove), so the list has to include them.

Story Owner: Hunter Harris

Story 2: Add a /remove command. As a server member, I want to remove a game from my wishlist so that my list only shows games I still want.

Acceptance Criteria

- Given a game is on my wishlist, when I run /remove with its name, the bot removes it and replies “Removed <game name> from your wishlist.”
- Given I removed a game, when I run /list, then that game no longer appears.
- Given the game is not on my wishlist, when I run /remove with its name, then the bot replies “That game is not on your wishlist.”
- Given another user has the same game on their wishlist, when I remove it from mine, then it stays on their wishlist.
- Given I type the name with different capitalization, when I run /remove, then the bot still finds and removes the game
- Given I start typing in /remove, then the bot suggests the games on my own wishlist.
- Given the database fails, when I run /remove, then the bot replies “Sorry, I couldn’t

remove that game right now."
- Given I run /remove in a DM, then the bot replies "Use this command in a server."

Tasks
- Add a remove_game function to db.py that deletes one game for user, ignoring capitalization, and tells the caller if nothing was removed (**Hunter**, 1 hour)
- Create the /remove command with wishlist suggestions as you type (**Hunter**, 2 hours)
- Create the reply messages for removed, not on your wishlist, and database errors (**Hunter**, 1 hour)
- Test and document the command, including a test that one user's removal does not affect another user's list (**Hunter**, 1 hour)

Risks
- Removing the wrong game if two names are similar. Match the full name, and suggest names from the user's own wishlist.
- A game is removed by accident and there is no undo. The user can add it again with /wishlist

Story Owner: Aidan Feess

Story 3: **Checking game prices by name.** As a user, I want to be able to enter in the name of the game I want to wishlist and see its price instantly when using the /pullpricing command.

Acceptance Criteria
- Given a game name that exactly matches a Steam game, when I run /pullpricing with it, then within 10 seconds the bot replies with that game's name and each available store's name, current price, original price, discount percent, and purchase link.
- Given a name that isn't an exact match but Steam's search returns results, when I run /pullpricing with it then the bot uses the top search result and shows that result's game name in the reply, so I can see which game was priced.
- Given a name that Steam's search returns no games for, when I run /pullpricing with it, then the bot replies "Game not found".
- Given I run /pullpricing with a Steam store link instead of a name, then the bot still returns prices the way it did before this story.
- Given an empty name or only spaces, when I run /pullpricing, then the bot replies "Enter a game name or Steam store link" and makes no lookup.
- Given the name search fails or doesn't respond within 10 seconds, when I run /pullpricing, then the bot replies "Prices are temporarily unavailable, try again later".
- Given I run /pullpricing in a DM, then the bot replies "Use this command in a server".

Tasks
- Rename the /pullpricing input from link to game, update its description to say it accepts a name or Steam link, and route links to the existing parser and anything else to the name search (Aidan, ~1 hour)
- Make an async version of the Steam name search that shares the 10 second deadline in pricing.py. Keep exact match first, then top result (Aidan, ~2 hours)

- Add the “Game not found” and empty input replies, make sure a search failure gives “temporarily unavailable” reply (Aidan ~1 hour)
- Write automated tests with mocked responses for each acceptance criterion (Aidan, ~1.5 hours)
- Update readme and docs with new name-search usage and error messages (Aidan, ~30 mins)

Risks

- **Name search can pick the wrong game.** Could pick sequel, different game in the same series, etc. Plan: prefer exact name matches, always show the matched game’s name in the reply so the user can tell.
- **Steam’s search endpoint isn’t documented and could rate limit bot.** Plan: Keep search in one function, on any failure give a temporarily unavailable reply.

Story Owner: Alayna Fields

Story 4: As a user, I want the bot to generate a daily digest. I want the bot to display what games are on sale, ping the user that wishlisted the on sale game, and display how many users want the on sale game.

Acceptance Criteria

- The bot will generate a digest on a daily basis at a specified time. This digest will display what games are on sale out of the games in the wishlist database. The digest will show how many users want the games that are on sale, and the users will be notified that the game is on sale.
- Given I have added a game to the wishlist that is on sale, the bot will generate the digest and ping me to let me know.
- Given I run /digest (may change), the bot will generate the digest and display all the specified information

Tasks

- Create a new bot command, /digest that can be called in 2 different ways. It can be called manually or it can be set to run at a specified time every day, or both. (Alayna, 2 hours)
- Design the command to display games that are on sale from the database, how many users want these games, and ping the users that wishlisted these games (Alayna, 3 hours)

Risks

- Checking the price of every wishlisted game can be slow or hit Steam's request limits, so the digest may be late or fail.
- Users could get pinged too often or about games they no longer want, which would annoy them.

- Price data from Steam can be wrong or out of date, which could cause a false sale alert.

Story Owner: Grayson Lessard

Story 5: Updates to /list
As a user, I want to be able to view a respective person's wishlist, when the /list command is used with a person's username.

Acceptance Criteria

- Given a username is used, when /list is run, then the bot will return that person's wishlist.
- Given no username is used, when /list is run, then it maintains normal output (wishlist of the whole server).
- Given a username that doesn't exist within the server, when /list is run, then the bot returns "This username does not exist"

Tasks

- Update the /list command to allow for the input of a username (this will be an optional setting) (Grayson, 2 hours)
- Make case handling for an invalid username (Grayson, 1 hour)

Risks

- The story and the current /list disagree on what /list shows without a username. If the story is not updated, teammates may undo the per-user change.
- Two members can have similar names, so the bot could show the wrong person's wishlist.
- Users who left the server may still have rows in the database.
